OMOP Mapping Review Cycle

2. EXPOSE (Databricks App)

Runs as service principal • SSO
Reads worklist + standard-concept picker via SQL Warehouse
Per-row buttons: Map | Reviews

Map

3. REVIEW (Researchers, by domain group)

Map form: REMAP / UNMAPPABLE / NEW_LOCAL_CONCEPT / NEEDS_INFO
Pick validated target (Standard + domain)
Confidence + rationale
Multiple visible, attributed reviews

write

reviewed

Lakebase (transactional review state)

review table (reviewer proposals)

approval table (approver decisions)

write

4. APPROVE (Governance)

Approve one / Merge / Reject / Return
Separation of duties
(approver != reviewer of same code)
On approve: status LOCKED

worklist

federated read

approved

Unity Catalog (analytical + system of record)

5. COMMIT (pipeline, periodic)

Federated read of approved entries
Upsert source_to_concept_map
Mint 2-billion concept (NEW_LOCAL_CONCEPT)
RE-DERIVE clinical *_concept_id (MERGE)
Affected codes only — never hand-edit

committed

6. TRACK & CLOSE

mapping_update_log: review_id, old to new, approver, timestamp
Provenance: ohdsi_maps_to vs s2cm_review
Coverage re-measured (climbs)
Committed codes drop off worklist

next data load (loop)

1. DETECT

Scan CDM clinical tables
Worklist: standard_concept_id = 0
1 row per source code, by domain
gap_type: vocab_gap | s2cm_gap
Priority = % unmapped in domain
Suppress counts < 11

State machine: open -> in_review -> reviewed -> approved (locked) -> committed
